*PLEASE NOTE. The Federal COBOL Compiler Testing Service may make full and free public disclosure of the Validation Summary Report (VSR) in accordance with the "Freedom of Information Act" (5 U.S.C. #552). The results of this validation are only for the purpose of satisfying United States Government requirements, and apply only to the Computer System, Operating System release, and compiler version identified in the VSR. The COBOL Compiler Validation System is used to determine, insofar as is practical, the degree to which the subject compiler conforms to the Federal COBOL Standard. Thus, the VSR is necessarily discretionary and judgmental. The United States Government does not represent or warrant that the statements, or any one of them, set forth in the VSR are accurate or complete. The VSR is not meant to be used for the purpose of publicizing the findings summarized therein.

For information concerning this compiler you can contact the vendor's designated representative named below:

Mr. David M. Nixon Digital Equipment Corporation 200 Forest Street Marlboro, Massachusetts 01752

SECTION 1. INTRODUCTION

1.1 Purpose of the Validation Summary Report

The purpose of the Validation Summary Report (VSR) is to identify individual COBOL language elements whose implementation does not conform to Federal Standard COBOL as adopted from American National Standard Programming Language COBOL, X3.23-1974, by Federal Information Processing Standard 21-1 (FIPS PUB 21-1).

1.2 Preparation of the VSR

The Validation Summary Report is prepared by analyzing the results of running the COBOL Compiler Validation System (CCVS). The COBOL Compiler Validation System consists of audit routines containing features of Federal Standard COBOL, their related data, and an executive routine (VP-routine) which prepares the audit routines for compilation. Each audit routine is a COBOL program which includes many tests and supporting procedures indicating the result of the tests.

The testing of a compiler in a particular hardware/operating system environment is accomplished by compiling and executing each audit routine. The report produced by each routine tells whether the compiler passed or failed the tests in the routine. If the compiler rejects some language elements by terminating compilation, giving fatal diagnostic messages, or terminating execution abnormally, then the test containing the code the compiler was unable to process is deleted and the audit routine compilation and execution repeated.

The compilation listings and the output reports of the audit routines constitute the raw data from which the members of the Federal COBOL Compiler Testing Service produce a Validation Summary Report.

1.3 Organization of the VSR

The Validation Summary Report is made up of several sections the contents of which are described below.

- a. Section 2 summarizes the results of the compilation and execution of the programs comprising the COBOL Compiler Validation System. Section 2 is subdivided into a subsection representing each level of each module defined in American National Standard Programming Language COBOL, X3.23-1974. Each subsection contains a list of all of the language elements which must be implemented in order to claim support of that level/module. The list of language elements will be annotated to include a description of both syntax and semantic errors detected during the validation.
- b. Section 3 FIPS PUB 21-1 defines four Federal levels of the COBOL * Standard. Section 3 of the VSR lists the discrepancies described in Section 2 by the Federal level in which the problem occurs.

- c. Section 4 contains information which describes the software environment in which the compiler was tested. This includes the name and version of the operating system; the implementor-names which were used in the Environment Division of the programs comprising the CCVS; the options used with the compiler; and if applicable, information regarding the use of compiler optimization features.
- d. Appendix A is the Validation Summary Working Document, a working paper resulting from the compilation and execution of the CCVS, and from which the VSR is derived.
- 1.4 Abstract Covering Compliance to American National Standard Programming Language COBOL

Definition of an Implementation of American National Standard Programming Language COBOL (excerpts from X3.23-1974, Chapter 1, Section 1.5).

An implementation is defined to meet the requirements of the American National Standard COBOL specification if that implementation includes a fully implemented specified level of each of the functional processing modules and of the Nucleus as defined in this Standard. It follows from this that, in order to meet the requirements of this Standard, an implementation must:

- a. Not require the inclusion of substitute or additional language elements in the source program, in order to accomplish any part of the function of any of the standard language elements.
- b. Accept all standard language elements contained in a given level of a module which is specified as being included in the implementation, except as specifically exempted (as pertaining to specific hardware components for which support is not claimed). See "Elements that Pertain to Specific Hardware Components" below.

These points are of particular pertinence in two areas:

- (1) There are throughout the American National Standard COBOL specification certain language elements whose syntax, or effect, is specified to be, in part, implementor-defined. While the implementor specifies the constraints on that portion of each element's syntax or rules that is indicated in this Standard to be implementor-defined, such constraints may not include any requirement for the inclusion in the source program of substitute or additional language elements.
- (2) When a function is provided outside the source program that accomplishes a function specified by any particular standard COBOL element, then the implementation must not require, except for Environment Division elements, the specification of that external function in place of or in addition to that standard language element:

The following qualifications apply to the American National Standard COBOL specification:

- a. There are certain language elements which pertain to specific types of hardware components. In order for an implementation to meet the requirements of this standard, the implementor must specify the minimum hardware configuration required for that implementation and the hardware components that it supports. Further, when support is thus claimed for a specific hardware component, all standard language elements that pertain to that component must be implemented if the module in which they appear is included in the implementation. Language elements that pertain to specific hardware components for which support is not claimed, need not be implemented. However, the absence of such elements from an implementation of American National Standard COBOL must be specified.
- b. An implementation of American National Standard COBOL may include the ENTER statement or not, at the option of the implementor.
- c. An implementation that includes, in addition to a specified level of each of the functional processing modules and of the Nucleus, elements or functions that either are not defined in the American National Standard COBOL specification or are defined in a given level of a standard module not otherwise included in the implementation, meets the requirements of this Standard. This is true even though it may imply the extension of the list of reserved words by the implementor, and prevent proper compilation of some programs that neet the requirements of this Standard. The implementor must specify any optional language (language not defined in a specified level but defined elsewhere in the Standard) or extensions (language elements or functions not defined in this Standard) that are included in the implementation.
- d. In general, the American National Standard CDBDL specification specifies no upper limit on such things as the number of statements in a program, the number of operands permitted in certain statements, etc. It is recognized that these limits will vary from one implementation of American National Standard CDBDL to another and may prevent the proper compilation of some programs that meet the requirements of this standard.

IMPLEMENTOR-DEFINED LANGUAGE SPECIFICATIONS

The language elements in the following lists depend on implementor definitions to complete the specification of the syntax or rules for the elements.

The elements whose syntax is partly implementor-defined are:

Implementor-Defined Aspect
computer-name
computer-name
integer
implementor-name; whether imple-

mentor-names are provided.

SPECI	AL-NAMES	paragraph
-------	----------	-----------

implementor-name

ASSIGN clause

implementor-name

VALUE OF clause

implementor-name; whether implementor-

names are provided.

RERUN clause

implementor-name and the form; the implementor provides at least one

of seven specified forms.

CALL and CANCEL statements

relationship between operand and the

referenced program.

COPY statement

relationship between library-name

text-name, and the library.

ENTER statement

language-name

Margin R

The location.

Area B

The number of character positions.

Qualification

The number of qualifiers; at least five must be supported.

The elements whose effect is partly implementor-defined are:

Element

Implementor-Defined Aspect

alphabet-name

The correspondence between native and foreign character sets.

implementor-name switches

Whether setting can change during execution.

USAGE IS COMPUTATIONAL clause

Representation and whether automatic alignment occurs.

USAGE IS INDEX clause

Representation and whether automatic alignment occurs.

atignment occurs.

SYNCHRONIZED clause

Whether implicit FILLER positions are generated; their effect on the size of group items and redefining items.

ACCEPT statement

Maximum size of one transfer of data in Level 1 Nucleus.

DISPLAY statement

Maximum size of one transfer of data in Level 1 Nucleus.

Numeric test

Representation of valid sign in the absence of the SIGN IS SEPARATE clause.

Comparison of nonnumeric items

Collating sequence, where NATIVE or implementor-name collating sequence is implicitly or explicitly specified.

Arithmetic expressions

Number of places carried for intermediate results.

Elements That Pertain to Specific Hardware Components

The standard language elements in the list that follows pertain to specific types of hardware components. These language elements must be implemented in an implementation of American National Standard COBOL when support is claimed, by the implementor, for the specific types of hardware components to which they pertain, and the module in which they are defined is included in that implementation.

Element	Hardware Component
CODE-SET clause	Device capable of supporting the specified code.
MULTIPLE FILE TAPE clause	Reel
CLOSEREEL/UNIT statement	Reel or mass storage
CLOSENO REWIND statement	Reel or mass storage
OPENREVERSED statement	Reel with the capability of making records available in the reversed order; mass-storage with the capability of making records available in the reversed order.
OPENNO REWIND statement	Reel or mass storage
OPENI-O statement (Sequential I-O only)	Mass storage
OPEN EXTEND statement	Reel or mass storage
REWRITE statement (Sequential I-O only)	Mass storage

SEND...BEFORE/AFTER
ADVANCING statement

Devices capable of vertical positioning; devices capable of action based on mnemonic-names.

USE...I-O (Sequential I-O only)

Mass storage

WRITE...BEFORE/AFTER ADVANCING

Devices capable of vertical positioning; devices capable of action based on mnemonic-name.

1.5 The Federal COBOL Standard

The COBOL compiler validation results enclosed in this document reflect the degree to which the subject COBOL compiler implements the Federal COBOL Standard. The Federal COBOL Standard is essentially the same as the American National Standard Programming Language COBOL, X3.23-1974, with two exceptions:

The Federal COBOL Standard defines 4 levels and the ANSI Standard defines only the minimum COBOL implementation and the full standard. Low and High levels of the Federal COBOL Standard (see 1.5.1) correspond to the above two ANSI levels (minus the Report Writer module). Two additional levels, low-intermediate and high-intermediate have been included in the Federal Standard between the highest and lowest subsets. These additional levels accommodate hardware which cannot support the full standard, but which is capable of implementing more than the minimum standard.

The Report Writer Module is not contained in the Federal COBOL Standard.

The Federal CCBOL Standard requires that a compiler contain as a minimum the elements specified in at least one of the Federal levels. No restrictions are imposed on the inclusion of selected features from higher levels or even unique vendor extensions. Compatibility amoung various implementations of a given level containing additional features must be controlled by management imposed standards and restrictions.

1.5.1 Federal Standard COBOL Levels

- a. Federal Standard COBOL specifications are the language specifications contained in American National Standard Programming Language COBOL, X3.23-1974. For purposes of the Federal Standard, the modules defined in X3.23-1974 are combined into four levels. Not all computers are large enough to accommodate a COBOL compiler containing the full ANSI Standard. Therefore, the Federal Government requires that all compilers acquired by its agencies contain as a minimum one of the four Federal levels, depending on machine size, configuration and user needs. The knowledge that all computers will support at least one of these four subsets simplifies the task of developing machine-independent COBOL programs.
- b. The four levels of Federal Standard COBOL are identified as: Low, Low-Intermediate, High-Intermediate, and High. Each Federal Standard COBOL level is composed of either the high or low levels of the nucleus and ten of the eleven Functional Processing Modules (FPMs) defined in X3.23-1974. The four Federal Standard COBOL levels are reflected in the following table. The numbers in the table refer to the level within the FPM or nucleus as designated in X3.23-1974, and a dash in the table denotes that the corresponding FPM is omitted.

	Low Level	Low Inter- mediate Level	High Inter- mediate Level	High Level
		Levet	Levet	Level
UCLEUS	1	1	2	2
FPMs				
TABLE HANDLING	1	1	2	2
SEQUENTIAL I-O	1	1	2	2
ELATIVE I-0	-	1	. 2	2
NDEXED I-0	-	-		2
ORT-MERGE	-	-	1	2
EPORT WRITER	-		-	-
SEGMENTATION	- T	1	1	2
IBRARY	-	1	1	2
DEBUG		1	2	2
INTER-PROGRAM				
COMMUNICATION	-	1	2	2
OMMUNICATION			2	2

1.5.2 Conformance to Federal Standard COBOL

A compiler implemented in conformance to Federal Standard COBOL must meet at least the following requirements.

- a. The implementation must include all of the language elements of at least one of the levels of Federal Standard COBOL.
- b. The implementation must meet all of the requirements defined in American National Standard COBOL, X3.23-1974, Section I, paragraph 1.5, Definition of An Implementation of American National Standard COBOL which is provided in section 1.4 of this VSR.
- c. The implementation must provide a facility for the user to optionally specify a level of Federal Standard COBOL for monitoring his source program at compile time. The monitoring will be an analysis of the syntax used in a source program against the syntax included in the specified level of Federal Standard COBOL. Any syntax used in the source program that does not conform to that allowed by the user selected level of Federal Standard COBOL will be diagnosed. The syntax diagnosed as not conforming to the specified level will be identified to the user through a diagnostic message on the source program listing. The diagnostic message will contain, at least: (1) The identification of the source program line number in which the nonconforming syntax occurs, (2) the identification of the level of Federal Standard COBOL that supports

the syntax or that the syntax is nonstandard COBOL.

1.6. Use of the VSR

The Federal COBOL Compiler Testing Service may make full and free public disclosure of the Validation Summary Report (VSR) in accordance with the "Freedom of Information Act" (5 U.S.C. #552). The results of the validation are only for the purpose of satisfying United States Government requirements, and apply only to the computer system, operating system release, and compiler version identified in the VSR.

The COBOL Compiler Validation System is used to determine, insofar as is practical, the degree to which the subject compiler conforms to the COBOL Standard. Thus, the VSR is necessarily discretionary and judgmental. The United States Government does not represent or warrant that the statements, or any one of them, set forth in the VSR are accurate or complete. The VSR is not meant to be used for the purpose of publicizing the findings summarized therein.

1.7 Sources of Additional Information

FIPS PUB 21-1 defines the Federal COBOL Language Standard. This publication is available from the Office of ADP Standards Management, National Bureau of Standards, Washington, D. C., 20234.

The detailed COBOL language specifications are given in the publication "American National Standard Programming Language COBOL, X3.23-1974", available from the American National Standards Institute, 1430 Broadway, New York, New York 10018.

An explanation of the COBOL Compiler Validation System is contained in the CCVS User's Guide. This document explains how to run the compiler validation system. The User's Guide and a magnetic tape containing a copy of the CCVS programs are available from the National Technical Information Service, Springfield, Virginia, 22151. (Ordering information can be obtained from the Federal COBOL Compiler Testing Service.)

1.8 Requests for Interpretation

Questions regarding this VSR or the CCVS in general should be forwarded to the FCCTS. If any problem cannot be adequately resolved through the FCCTS, the request for interpretation will be forwarded to the Federal COBOL Interpretation Committee for final resolution.

A brochure describing the validation process including the procedures for requesting a validation and resolution of questions involving interpretation of the current Federal Standard is available from the Department of the Navy, Federal COBOL Compiler Testing Service, Washington, D.C. 20376.

1.9 Federal Standard COBOL Approved Interpretation

The National Bureau of Standards published in the Federal Register Vol. 41

No. 179, September 14, 1976, an approved interpretation of Federal Standard COBOL as pertains to the evaluation of arithmetic expressions in the COMPUTE statements. This interpretation states that "size of the intermediate result field is implementor-defined."

Since the results of evaluating arithmetic expressions are not predictable, all COMPUTE statements and IF statements containing arithmetic expressions have been removed from the COBOL Compiler Validation System.

1.10 Timeliness of the Validation Summary Reports

The timeliness of the Validation Summary Report is important. Compilers and their related operating system software are modified several times a year. The Compiler Validation System used to validate compilers is also updated during the life of the system. Therefore to ensure that the latest version of both the vendor's compiler and the Validation System are the latest officially released versions, check with the:

Director
Federal COBOL Compiler Testing Service
Department of the Navy
Washington, D. C. 20376
(202) 697-1247

Please use the Validation Summary Report number of this report when corresponding with the Testing Service.

SECTION 2. DETAILED EVALUATION OF ERRORS.

This section summarizes the results of the compilation and execution of the programs comprising the COBOL Compiler Validation System (CCVS). The version of the CCVS used during this validation is shown inside the front cover of the VSR.

Section 2 is made up of a variable number of subsections. The number of subsections is dependent on the Level of Federal COBOL being validated. There will be a subsection for each level of each module which is validated. If the high level of a module is validated then there will be two subsections for that module; one for the low level and one for the high level.

A validation of the low level of Federal Standard COBOL would result in three subsections being present. One for Nucleus level 1, one for Sequential I-O level 1, and one for Table Handling level 1.

Each error or deviation noted in this section makes reference to a program or functional COBOL module contained in Appendix A (Validation Summary Working Document). This reference provides the documented results of an occurrence of errors/deviataions detected during the running of the CCVS using the compiler within the environment identified within this document. The Validation Summary Working Document is presented in sequence by functional module, functional module level and program number as defined below.

Each program in the COBOL Compiler Validation System is identified by a 5-character program name. The name associates the routine with the functional processing module and level of American National Standard Programming Language COBOL tested within the program.

The five character name has the general format XXNMM. The first two characters are alphabetic and identify the functional module tested by the program. The permissable values are:

CM - Communication

DB - Debug

IC - Inter-Program Communication

IX - Indexed I-0

LB - Library

NC - Nucleus

RL - Relative I-0

RP - Report Writer

SG - Segmentation

SQ - Sequential I-0

ST - Sort-Merge

TH - Table Handling

The third character of the audit routine name is either a 1 or 2, and identifies the level of the functional module being tested. Each module and level is represented by several programs. The fourth and fifth characters of the program name are sequence numbers for programs which test features in the

same level of the same functional processing module.

As an example, the program name NC210 is the tenth program in the series of routines which test the second level of the Nucleus module.

Description of Section 2.

Each error/deviation is noted by number in the left hand margin opposite the language element in question. This number is used in section 3 to categorize errors by Federal level (See 1.5.1). Inserted directly below the language element is a brief description of the error. To the right of the language element is a page reference to X3.23-1974, American National Standard Programming Language COBOL. The reference at the end of the description of the error is to Appendix A which contains the detailed information collected during the validation. The reference is made up of the routine name followed by an A or B (A for compile time or syntax error and B for execution time or semantic error) and a number which makes the error unique in Appendix A.

Example:

2.1 Nucleus Level 1

Operational symbols: S V P

11-21

- * The scaling character "P" is not permitted in a
- * PICTURE character-string.

(NC101.A.2)

- 2.2 Sequential I-O Level 1
- 2.1.9 represents the ninth error for Nucleus Level 1
- II-21 represents the page in x3.23-1974 where the language element is defined
- Boxes the description of the error/deviation

NC101.A.2 represents:

Program name - NC101

Syntax error - A second error - 2

SECTION 3. COMPILER STATUS

Section 1.5 explains the four levels of Federal Standard COBOL. This section lists the discrepancies described in Section 2 by the Federal level in which the problem occurs. All errors listed for a lower level are also errors in any higher level, even though they are listed only in the lower level. The paragraph number from Section 2 is used to reference the errors in each Federal level.

3.1. Low Level

- 2.1.1 Switches are not supported.
- 2.1.2 PICTURE as last word on line results in error.
- 2.1.4 DISPLAYed numeric data is incorrectly edited.
- 2.5.1 Compiler rejects CODE-SET IS ... clause #/o 'IS'.
- 2.5.2 Non-standard code required for ASCII (X3.4) tape files.

3.2. Low-Intermediate Level

2.17.1 Debug module is not supported.

3.3. High-Intermediate

- 2.2.1 INSPECT statement with multi-character operands and multiple TALLYING and REPLACING operands did not execute correctly.
- 2.6.1 OPEN EXTEND failed to position to following last record in file.
- 2.6.2 USE...EXTEND is not supported.
- 2.6.3 WRITE...BEFORE...END-OF-PAGE... fails end-of-page condition.

3.4. Hich Level

2.9.1 Checkpoint file specified by RERUN clause unable to be restarted. 2.10.1 ALTERNATE RECORD KEY clause is not supported.

SECTION 4 SOFTWARE ENVIRONMENT.

The compiler referenced in this document was validated using the software environment described in this section. When using a modification of the described environment, the compiler may or may not continue to conform to the Standard. It should be noted that during the validation process, an attempt is made to validate as many different options as possible.

The use of compiler options, implementor-names in the Environment Division and any form of optimization which is not described in this report could cause the compiler to produce a program that does not perform according to the specifications of Standard COBOL. Only the environment described in this document has been used with this compiler to satisfy the requirements of FIPS PUB 21-1 and FPMR 101-32.1305.1a. (Any deviations which must be corrected as per the referenced FPMR are described in Sections 2 and 3 of this report.)

1. Options or parameters used on the processor call statement for the compiler: The following options/parameters were used during the validation.

Options specified:

None

Options defaulted:

N/A

2. Environment Division implementor-names.

Printer destined files

LPT

Tape files

MTAN

Sequential Mass-storage files

DSK

Random Access files

DSK

Sort files (SD)

DSK.DSK.DSK

Switch names

Not supported by the compiler.

Source Computer names

DECSYSTEM-20

Object Computer names

DECSYSTEM-20

RERUN Clause option

RERUN EVERY 10 RECORDS OF RR-FS1

3. Optimization. The compiler may or may not have optimization features. If there was an optimization feature available, it was used during the validation process (during a separate execution of the Compiler Validation System) to determine if its use causes the compiler to produce a program which does not give the expected results. If the optimization is invoked through the compiler call statement then it is mentioned in paragraph 1 above. If it is invoked through the introduction of syntax in other than the Data and Procedure Divisions of the source program it is shown below. Optimization which would require modification to the Data and Procedure Divisions is not considered in this report in that it is beyond the scope of the use of standard COBOL and the validation process.

Optimization was not considered for this validation.

4. Compiler.

CBL74 Version 1A

5. Operating system.

TOPS-20 V2

5. ASCII Validation

ASCII Validation is performed by running a sequence of three CCVS74 programs (SQ118, SQ119, SQ120) using special procedures. The purpose of this special run is to validate that in fact the compiler/operating system being tested is capable of processing an ASCII tape file and an ASCII card file produced (in accordance with the appropriate American National Standard) on another system. There is also a magnetic tape and a card file created in ASCII during the validation which will be taken to another system for further processing to determine whether the compiler/operating system being tested can also produce ASCII files.

This testing is based on several American National Standards and presumes their support by the compiler/operating system being validated. These are:

- 1. American National Standard Programming Language COBOL X3.23-1974
 - The CODE-SET clause is used to read and write the ASCII files.
 - The PROGRAM COLLATING SEQUENCE clause is used to process the data in ASCII mode as well as native mode.
 - The SIGN...SEPARATE clause is used for signed data and all data is in the DISPLAY (character) mode...
- American National Standard Code for Information Interchange (ASCII) X3.4-1968. (Note that this describes the code, not the labeling and tape recording formats.)
- American National Standard Hollerith Punched Card Code, X3.26-1970.
- 4. American National Standard Magnetic Tape Labels for Information Interchange, X3.27-1969.
- American National Standard Recorded Magnetic Tape for Information Interchange (800 CPI, NRZI), X3.23-1967.
- 6. American National Standard Recorded Magnetic Tape for Information Interchange (1600 CPI, PE), X3.39-1973.

The language of the 1974 COBOL Standard provides the capability to accept, process, and produce ASCII code. The ASCII Standard describes the code insofar as the bit arrangement and configuration, but does not address recording techniques, record formats or any labeling scheme. The 800 CPI, NRZI magnetic tape recording standard was used to establish the recording density and techniques. (1600 CPI, PE based on X3.39-1973 "Recorded Magnetic Tape for Information Interchange" could be used under special arrangements.) The tape labeling scheme used in these tests is based on X3.27-1969 but is also compatible with the revision to that tape label standard. Only the VOL1, HDR1, and EOF1 labels are used. The records are fixed length and unblocked.

During the validation, the Validation Manager for the Federal COBOL Comoiler Testing Service would use the necessary ASCII magnetic tape and card files in addition to the normal tape files associated with a validation. For the ASCII portion of the validation the following steps are performed:

- 1. The tape file and card deck (produced on another computer system) are used as input to several programs designed to validate whether the system being validated can accept and process ASCII data. Any changes made during this validation to the source programs reading the data are noted below.
- 2. A tape file and card file are produced during the validation which should prove to be identical to the files described in 1 above. These two files are then processed on a different computer system to determine the degree to which the system being validated supports the ASCII standard. Any changes made during this validation to the source program producing the data are noted below.

Results for this Validation

The system was able to produce but unable to read the required ASCII tape files based on reference 2 above. Only the first record from the input magnetic tape file provided by FCCTS was processed before an end-of-file condition was encountered. A total of 50 records should have been processed.

On the other hand, the output tape file was created with an additional character preceding each record on the file. This resulted in each record being offset by one character when the file was verified.

The 800 CPI NRZI magnetic tape recording format was used for this validation (reference 5 above). The following modifications had to be made in order to fulfill the ASCII validation requirement.

- 1. The tape labeling standard (reference 4 above) is not supported by the Operating System used during the validation. An unlabeled tape file was used as input and the LABEL RECORDS clause in each of the source programs was modified to reflect OMITTED labels.
- The nonstandard clause "RECORDING MODE IS STANDARD-ASCII" was added to the SELECT statement of each of the tape files in order to use the ASCII code described in reference 2 above. (Note -The CODE-SET clause in the File Description Entry which should have accomplished this function did not, thus the introduction of the nonstandard RECORDING MODE clause.)

APPENDIX A

VALIDATION SUMMARY WORKING DOCUMENT

A-1 This appendix is a working paper produced during the validation and documents the results of the compilation and execution of each of the programs comprising the CCVS. The results contained herein are based on the use of the compiler within the Validation Environment identified in this appendix. This appendix (Validation Summary Working Document) is not part of the official Validation Summary Report (VSR) and is not intended to reflect in any way the compiler's usefulness or degree of conformance to the language specifications.

The reader of this appendix should keep in mind that the same problem area may appear in more than one program, but is considered only as one single discrepancy and as such is reflected only once in the body of the VSR. (The VSR will in turn only reference the first occurrence of the problem in the appendix.)

This appendix is divided into two parts. The first part describes the Validation Environment. The second part of the document is divided into categories of information: compilation and execution results.

The reference document for COBOL is FIPS PUB 21-1 (X3.23-1974).

VALIDATION ENVIRONMENT

COMPILER IDENTIFICATION: DIGITAL EQUIPMENT CORPORATION, CBL74 VERSION 1A

COMPUTER SYSTEM: DECSYSTEM-20 MODEL 2050

OPERATING SYSTEM: TOPS-20 V2

DEBUG MODULE

03101 thru 08105, 03201 thru 08204

The test set for this module was not run since the standard DEBUG MODULE has not been implemented in this compiler.

INTER-PROGRAM COMMUNICATION, LEVEL 1 IC101 thru IC115, IC151, IC152

- A. Compilation
 No errors.
- B. Execution

 No failures.

INTER-PROGRAM COMMUNICATION, LEVEL 2 IC201 thru IC208

- A. Compilation
 - No errors.
- B. Execution
 - No failures.

INDEXED I-O, LEVEL 1

IX101 thru IX105

A. Compilation

No errors.

B. Execution

No failures.

1x106

A. Compilation

No errors.

B. Execution

The program fails to execute when restarted from the checkpointed file created through the use of the RERUN clause.

Ix107

A. Compilation

No errors.

B. Execution

No failures.

INDEXED 1-0, LEVEL 2

IX201 thru IX204

A. Compilation

No errors.

B. Execution

No failures.

IX205 thru 1X208

A. Compilation

In IX205 through IX208, all references to ALTERNATE RECORD KEYs were rejected as "IMPROPER CLAUSES".

B. Execution

IX205 through IX208 were not run because of ALTERNATE KEY tests (not supported).

LIBRARY, LEVEL 1
LB101 thru LB107

- A. Compilation
 No errors.
- B. Execution
 No failures.

LIBRARY, LEVEL 2

L3201 thru L8205

A. Compilation

No errors.

B. Execution

No failures.

LB206

A. Compilation

No errors.

B. Execution

LB206 had one test failure because that test involved the use of debug lines which are not supported by the compiler.

LB207

A. Compilation

No errors.

B. Execution

No failures.

NUCLEUS, LEVEL 1

NC101 thru NC108

A. Compilation

All references to hardware switches were optioned out prior to validation since the system does not provide switches.

B. Execution

No failures.

NC109

A. Compilation

No errors.

B. Execution

In NC109, NC157 and NC204 all tests involving the DISPLAYing of numeric data items failed. The correct and computed results are as follows:

TEST	CORRECT RESULTS	COMPUTED RESULTS
DISF-TEST-3	0123456789	123,456,789
DISP-TEST-7	1001234567894	16123,456,789A
DISP-TEST-13	E 0102030405	E 12345

NC110 thru NC120, NC151 thru NC156

A. Compilation

All references to hardware switches were optioned out prior to validation since the system does not provide switches.

B. Execution

No failures.

. NC157

A. Compilation

In NC157 and NC205 when the word PICTURE (or PIC) is the last word on a line of source code within the PICTURE clause the compiler rejects the succeeding line of source code indicating that a PICTURE and positive integer are required. In NC157 the PICTURE clause and LONG-

TEST-3 which tests this construct were deleted in order to obtain a clean compile. In NC2D5 all blank lines within the flagged PICTURE clauses were deleted.

B. Execution

No failures.

VC158

A. Compilation

No errors.

B. Execution

See NC109.

NC159 thru NC165

A. Compilation

No errors.

B. Execution

No failures.

NUCLEUS, LEVEL 2

NC201 thru NC203

A. Compilation

No errors.

B. Execution

No failures.

VC204

A. Compilation

No errors.

B. Execution

See NC109.

VC205

A. Compilation

See NC157.

B. Execution

No failures.

VC206 thru NC215

A. Compilation

No errors.

B. Execution

No failures.

NC216

A. Compilation

No errors.

B. Execution

In NC216, the following INSPECT test is executed:

INSPECT identifier-1 TALLYING identifier-2 FOR ALL "A" identifier-3 FOR LEADING "AH" identifier-4 FOR CHARACTERS BEFORE "." identifier-5 FOR CHARACTERS AFTER "AL" REPLACING

FIRST "L " BY "ZZ" AFTER INITIAL "AL" FIRST "BAD" BY "ZZZ" AFTER "L " LEADING "BAD" BY "ZZZ" BEFORE INITIAL "Q" FIRST "BAD" BY "ZZZ" BEFORE INITIAL "Z" FIRST "BAD" BY "ZZZ" AFTER "ALL" ALL "." BY "Z" AFTER "ALL"

The initial contents of identifer-1, PICTURED as X(83), is:

AH YES AH YES W.C. FRITOES HERE. ANYONE WHO HATES DOGS AND KIDS CAN NOT BE ALL BAD.

The test gave the following error indications:

	COMPUTED VALUE	CORRECT VALUE
identifier-1 (last eight char. final value)	ALZZBADZ	ALZZZZZ
identifier-3	1	0
identifier-4	15	13
identifier-5	6	5

For identifer-1, since the boundary for comparison in the second REPLACING phrase (AFTER *L *) is established before *L * is replaced by *ZZ* (first REPLACING clause), *BAD* will indeed be matched and replaced by *ZZZ*. [See II-71, 6(c).]

for identifier-3, the second TALLYING for leading "AH" will never participate in a comparison because each "A" in the first TALLYING clause operation is matched prior to the "AH" comparison. The match of "A" terminates the comparison cycle on the "A" and starts a new comparison cycle on the character that is immediately to the right of the matched "A". [See II-70 5(c) and II-71 6(c).]

For identifier-4, whenever an "A" match is made by the first TALLYING clause, the third TALLYING clause is not performed, so the count of "CHARACTERS BEFORE "." is 13 (or 15 - 2) and not 15.

For identifier*5, and for the same reason as above, the number of "CHARACTERS AFTER "AL"" is 5 and not 6, since the "A" in the last six characters of the string is matched by the first TALLYING clause, and thusly is not eligible for matching by the fourth TALLYING clause.

NC217, NC218

- A. Compilation
 - No errors.
- B. Execution
 - No failures.

A. Compilation

No errors.

B. Execution

No failures.

SQ118, SQ119, and SQ12D

- A. Compilation
 - 1. In SQ119 and SQ120, fatal errors were flagged on the construct

"CODE-SET ASCII-CODE"

located in the file description (FD) for a sequential file. In each case when the optional word "IS" was added the compiler accepted the syntax of the statement containing the CODE-SET clause.

- 2. In SQ118, SQ119, and SQ120 the nonstandard clause "RECORDING MODE IS STANDARD-ASCII" had to be added to the SELECT statements for the files which produced/read ASCII tape files during the ASCII validation of the Compiler/Operating System. The CODE-SET clause in the File Description Entry was present for these tape files and the use of the nonstandard clause should not have been necessary.
- B. Execution

No failures.

\$3121 and \$0151 thru \$0153

A. Compilation

No errors.

B. Execution

No failures.

SEQUENTIAL ACCESS, LEVEL 2

\$9201

A. Compilation

No errors.

B. Execution

No failures.

52202

A. Compilation

No errors.

B. Execution

In SQ202, SQ213, and SQ214 the execution of all WRITE...BEFORE... END-OF-PAGE statements failed to execute the end-of-page phrase on an end-of-page condition when the printer was positioned into the footing area of the page body.

\$9203 and \$9204

A. Compilation

No errors.

B. Execution

No failures.

\$9205

A. Compilation

No errors.

8. Execution

S0205 creates magnetic tape and mass storage files of 750 records each. Then each file is closed and reopened with an OPEN EXTEND statement and an additional 250 records are written on each file. S0205 failed to execute properly when a premature end-of-file exit was taken on a normal read operation.

. 50206 thru 50212

A. Compilation

No errors.

B. Execution

No failures.

SQ213 and SQ214

A. Compilation

No errors.

B. Execution

See SQ202.

\$2215 thru \$9217

A. Compilation

No errors.

B. Execution

No failures.

50218

A. Compilation

The compiler rejected as invalid the statement:

USE AFTER ERROR PROCEDURE EXTEND

indicating that it was in conflict with a second USE statement which followed it. This USE statement and SEQ-TEST-001 which tests this construct were deleted in order to obtain a clean compile.

B. Execution

No failures.
